1936
1938 # CELL 6: Convex Model Solver (Efficient Soft-Impute) - Renumbered
1939 # ------ #
1940 """
1941 Soft-Impute implementation (Mazumder et al., 2010)
1943 • Works with **NumPy/SciPy** on CPU and **CuPy** on GPU - the backend is
1944 detected automatically.
1945 • Accepts
1946
      - `X_incomplete` as a dense `numpy.ndarray` / `cupy.ndarray` *or*
         a sparse `scipy.sparse` / `cupyx.scipy.sparse` matrix whose
1947
1948
         *missing* entries are encoded as **NaN**.
1949 • Returns either a fully-filled dense array *or* the `(U,S,V)` factors.
1950
1951 This is intentionally self-contained - you can drop the file into any
1952 project (pure Python, no extra deps beyond SciPy/CuPy).
